

QIX alternative search heuristic test results

Nils Fagerberg & Daniel Odenbrand

August 2016

Here we present our runtime statistics when running our implementation of the algorithm in QIX with the alternative search heuristic to solve random instances of the warehouse problem with different attributes. Every attribute is either of the value 'Low' or 'High'. The first table displays what high and low for the different attributes represents.

Attribute \ Value	Low	High
Demands	Demands on $\frac{1}{4}$ of all products	Demands on all products
Sparsity	No warehouses are empty	$\frac{1}{2}$ of all warehouses are empty
Products	Warehouses have at least 0 of each product	Warehouses have at least $\frac{1}{5}$ of the maximum demand of each product

Furthermore a column having the value '**' means that it did not terminate within a reasonable time frame (>12 hours). A value of '**' means that we did not bother to run the instance at all since the problem is considered harder than a previously unfinished problem.

In our implementation we put the values from the hypercube built by QIX in hashes for easy access, that is we spend some time building the model. This time is represented by Setup time in the tables below, while Algorithm Time is the time spent on the actual algorithm.
